ase find my colleague's comments about your task solution:

- There are no clear instructions how to run the program.
- Code formatting is really bad. There are a lot of unused methods and imports, variable names are bad, a lot of unnecessary empty lines and spaces.
- Some tests don't have assertions.
- In some cases wrong access modifiers are used.
- It's hard to read the program due to unnecessary logic (like different date formats).
- Bad naming conventions, some API methods end with a slash, HTTP response is 200 even though validation is not successful.
- There are a lot of filtering methods. One method would be enough.
- A lot of code duplication.
- Some programming flaws - strings are compared using ==, | is used instead of ||, .etc.
- Package names are ok.
